Professional Summary

Aspiring Software Developer with a strong foundation in software development and data analysis. Proven track record in developing real-time traffic control systems and predictive models, achieving up to 94% accuracy. Skilled in C++, Python, and data analysis, with a focus on optimizing system performance and delivering data-driven solutions. Known for analytical problem-solving and technical versatility.

Education

GL Bajaj Institute of Technology and Management – Greater Noida, Uttar Pradesh

May 2026

B.Tech in Computer Science (Data Science)

JP International School – Uttar Pradesh

2022

Class XII (CBSE)

Experience

Software Developer Intern – Ozibook Tech Solutions Pvt. Ltd.

Aug 2025 – Jan 2026 | Bangalore, Karnataka

- Developed a real-time traffic control system in C++ using OOP and the Map library for data mapping, processing 10,000+ vehicle data inputs per minute via GitHub-based version control to enhance intersection safety and reduce carbon emissions.
- Implemented optimized data structures and algorithms, reducing signal decision time by 35%.
- Improved system performance and memory efficiency, achieving 30% faster execution and 22% lower memory usage.
- Designed dynamic signal timing logic, reducing average vehicle waiting time by 25% and improving emergency vehicle response times.
- Proposed efficient memory management and modular architecture within a 15-member cross-functional team, collaborating with data analysts and software testers to improve system scalability and support real-time processing of high-volume traffic data.

Technical Skills

Languages: C++, SQL, Java, Python

Tools: Visual Studio Code, Git, GitHub

Concepts: Data Structures, Algorithms, Object Oriented Programming

Soft Skills: Analytical thinking, Problem-solving, Teamwork, Self-motivation

Database: MySQL

Libraries & Tools: Pandas, NumPy, OpenCV, Matplotlib

Web: HTML, CSS

Other Skills: Data Preprocessing, Debugging, Code Optimization

Machine Learning: Linear Regression, Decision Tree, Logistic Regression, Data Visualization, Statistical Modeling

Projects

Chronic Disease Prediction Model

Aug 2025

- Initiated a chronic disease prediction system using Python and machine learning, achieving 92% accuracy and enabling early risk detection that prioritizes high-risk patients 2× faster than manual assessment.
- Performed feature selection and handled missing/inconsistent data on 5,000+ records sourced from Kaggle, increasing dataset reliability by 30% and model performance by 27%.
- Developed a Tkinter-based user interface to streamline input, reducing prediction time by 40%.
- Visualized health trends using Matplotlib, improving decision-making efficiency by 35%.
- Optimized the machine learning pipeline, reducing prediction time by 30% and improving overall model efficiency.

Covid 19 Detection Model

Aug 2024 – Feb 2025

- Created a COVID-19 detection system using Python, OpenCV, and Logistic Regression, achieving 94% accuracy with faster inference and lower computational requirements compared to complex models like CNNs.
- Processed and analyzed 3,000+ patient images and symptom records sourced from Kaggle, ensuring data anonymization and improving screening efficiency by 40%.
- Operated a Flask-based web application to collect patient data and automate analysis, reducing manual processing time by 50%.
- Composed secure data handling and structured storage, ensuring 100% reliable record management.
- Automated PDF medical report generation, reducing report creation time from 5 minutes to under 30 seconds.
- Improved early screening capability, enabling 2× faster preliminary diagnosis compared to manual methods.
